

0007 Browser vs Node.js

Sunday, 25 June 2023 9:37 AM

- Generally we executed our JS code on web browser.
- There are some key differences between browser based vs. Node base code.
- In browser, most of time what you are doing is interacting with the DOM, or other web platform APIs like cookies. → Not exist in Node.js
You don't have the document, window & all other objects that are provided by the browser. → Not exist in node.js

DOM:- document object model. is programming interfaces for web documents. It represents the pages so that programmers can change the document structure, style & content. The DOM represents the Document as nodes & objects; that way programming language can interact with the page.

- In the DOM, all HTML elements are defined as an OBJECT. The programming interface is the properties & methods of each object. A property is a value that you can get or set (like changing the content of an HTML element). A method is an action you can do (like add or deleting HTML element)
- There are basically 3 Types of DOM.
 - * Core DOM:- standard model for All document Type.
 - * XML DOM:- standard model for XML documents.
 - * HTML DOM:- standard model for HTML documents.

- In browser, we don't have all the nice APIs that Node.js provides through its modules.
e.g The FS: File System Access functionality etc.

- With Node.js, you control the environment.
 - We know which version of node.js an Application runs on, we can write all the modern ESX[6,7,8,9,...] JS Additional features that node.js app can support.

- With browser, we are at the mercy of what the User choose. Browser dependancy.

Summary of Section - I

- ECMAScript
- Chrome's V8 engine
- JS runtime
- Understood Node.js visually & through code
- Hello World program - outside the browser
- Browser vs Node.js
