

- In previous lecture we learned how to load module using `require()` ⚡.
- A requiring module, we are basically asking V8 Engine to execute All code in that module.

What if we want to create & reuse the Block of code which exposed certain functionality that can be consumed by external files or Apps?

How?

- We can do that using the special `"module.export"` object that is always readily available in node.js.

Code:-

add.js) ...

```
const add = (a, b) => {
  return a + b;
};
```

```
// const sum = add(8, 5);
// console.log(sum);
```

`module.exports = add;`

- in add.js file instead of calling particular module portion ⚡ & logging its value to console
So here we comment it ---

- We going to export `add()` ⚡ from module/file.
- for that we assigns `add` ⚡ to the `module.exports` object.

- What is special about this object?
→ The value of this object is what, the `require()` ⚡ returns to corresponding module.

→ This allows us to store `add()` in any constant in calling module

index.js

```
const add1 = require("./add");
```

```
console.log("Hello");
```

```
const sum1 = add1(10, 20);
```

```
console.log(sum1);
```

```
const sum2 = add1(80, 30);
```

```
console.log(sum2);
```

```
;
```

- Using this module variable we have to call particular module ⚡ by passing appropriate parameters & catch the return value if any in one variable.

- Use this value using the particular variable.

- By this way we can call particular module ⚡ any number of times As it is reusable block code.

- You can create new functionality such as `add()` ⚡,
- expose it using this special `module-export` object
 - import it in different-different file by using `require()` ⚡.
 - & use it as many times as you want to do.

This is common JS format for exporting & importing ⚡ that node.js do.

index.js script1.js script2.js + 3zeb4qktj NEW NODEJS RUN

```
1 /**
2  * In main file
3  * let script1 = require('./script1');
4  * console.log(script1.sum(1, 2));
5  */
6 /**
7  function sum(a, b) {
8      return a + b;
9  }
10
11 module.exports = { sum };
12 */
13
14 const add = (a,b) => {
15     return a + b;
16 }
17 const sum = add(4,5);
18 console.log(sum);
```

STDIN
Input for the program (Optional)

Output:
9
3
Hello, World!

NodeJS Online Compiler

Write, Run & Share NodeJS code online using OneCompiler's NodeJS online compiler for free. It's one of the robust, feature-rich online compilers for NodeJS language, running on the latest LTS version NodeJS 16.14.2. Getting started with the OneCompiler's NodeJS editor is easy and fast. The editor shows sample boilerplate code when you choose

The screenshot shows the OneCompiler website interface. At the top, there's a browser address bar with 'onecompiler.com'. Below it, the OneCompiler logo is visible. The main area features a code editor with a file named 'index.js' containing the following code:

```
1 require("./script1.js");
2 const sum1 = require("./script2");
3
4 //console.log("sum from script is called : " , sum1(2,3));
5 //console.log(sum1.sum(1,2));
6 //console.log(sum1.sum1_1(6,6));
7 // console.log(sum1.sum2(8,8));
8
9
10
11 console.log("Hello, World!");
```

Below the code editor, there's a 'RUN' button. To the right of the code editor, there's a 'STDIN' section for input and an 'Output' section showing the results of the execution:

Output:

```
9
3
Hello, World!
```

At the bottom right, it says 'created 8 hours ago by Prof. Jigneshkumar Shah'.
